Team details

Project Title: Where Are Your Teammates?
Team Name: Ice Breaker
GitHub URL: https://github.com/wpeng27/DECO3500_Team_8

Per Member

Gao, Zhaoyi:
Bachelor of Information Technology
zhaoyi.gao1@student.uq.edu.au
My goal for this project is to gain more experience in working collaboratively on a real world design project and improve my ability to turn user needs into practical design solutions.
Duties: Conducting user research, contributing to prototype development, and assisting with user testing and evaluation. Aka. Team Leader

Cheng, Zhifeng:
s4626160@student.uq.edu.au
Master of Computer Science (management)
My goal for this project is to strengthen my ability to translate research insights into a working social and mobile computing solution — particularly bridging the gap between identifying a real user problem and designing a system that genuinely addresses it. As someone from a computer science management background, I also hope to grow my confidence in taking ownership of ambiguous, open-ended problems where the "right" solution isn't obvious from the start, and to develop better instincts for balancing technical feasibility with user-centred design decisions.
Duties: Leading topic/domain research, contributing to concept brainstorming, and troubleshooting technical implementation issues

Peng, Weijie:
Bachelor of Computer Science
weijie.peng@student.uq.edu.au
To contribute meaningfully to the project while developing experience in areas outside my existing strengths, particularly by taking on responsibilities that challenge me and improve my ability to work effectively as part of a software development team.
Duties: Team management, Taking responsibility, Paper research, Help out team members in need, Team communication

Wang, Xueming:
Master of Interaction Design
xueming.wang@student.uq.edu.au
My goal is to experience the full process of developing a social and mobile computing project that addresses a real-world problem.
Duties: I can contribute to user research, project evaluation and prototype development.

Guo, Lei:
Master of Interaction Design
l.guo3@student.uq.edu.au

Personal goals:
I want to improve my ability to turn research evidence into a clearly defined design opportunity and contribute more confidently to collaborative design decisions. I also hope to challenge myself by participating in user research and prototyping, rather than focusing only on literature review.
Assigned duties:
- Conduct and synthesise relevant academic and contextual research.
- Help plan and carry out user research.
- Take responsibility for user testing.
- Document the evidence and rationale behind key design decisions.

Communication Plan

WeChat will be the primary channel for day-to-day communication, including questions, updates, and coordination between team members. University email will be used for important communications if WeChat is unavailable, particularly for formal communication with teaching staff or team members.

Team members should respond to messages within 24 hours. Urgent project-related messages should be responded to as soon as reasonably possible.

The team will meet once per week, with additional meetings scheduled when required before major milestones. Meetings will generally be held online through Zoom, with face-to-face meetings used when practical. The team meeting will be scheduled on Saturday each week at 11 am.

Meetings will have a short agenda covering progress since the previous meeting, current tasks, issues/blockers, and tasks for the following week. Important decisions and action items will be recorded so everyone has a clear understanding of their responsibilities.

The team will aim to reach decisions through discussion and consensus. If consensus cannot be reached, the team will use a majority vote. The team lead will help facilitate decisions and resolve disagreements where necessary.

GitHub will be used as the central platform for managing the project's source code and development work. Team members will create separate branches for features or tasks, make regular commits, and submit pull requests before merging changes into the main branch. Issues will be used to track tasks, bugs, and project requirements, while the GitHub project board will be used to monitor progress.

Conflict resolution plan

What conflict looks like: Conflict may include missed communication, repeated late responses, poor-quality or incomplete work, missed deadlines, unequal contribution, disagreements about technical decisions, or behaviour that negatively affects the team.

How issues are raised: Team members should raise concerns directly and respectfully with the person involved as soon as possible. Issues should focus on the work, project requirements, and potential solutions, rather than personal criticism or emotions.

Team expectations: All team members are expected to communicate with each other peacefully and respectfully. Everyone should focus on achieving better project performance and improving the quality of the work rather than reacting emotionally or assigning blame.

Resolving disagreements: The people involved should first discuss the issue privately and attempt to reach a practical solution. If necessary, the team can discuss the issue collectively and agree on specific actions, responsibilities, and deadlines.

If the issue cannot be resolved: If an issue continues after reasonable attempts to resolve it internally, the team leader will facilitate a final discussion and help establish an agreed resolution. Only if the team is still unable to resolve the issue should the matter be escalated to the appropriate teaching staff. This ensures that the team makes a genuine effort to resolve conflicts independently before seeking external intervention.
